

NFX-Datasheet

Component : ImagePreloader

Version : 5.00 | **NOF 2/3** **NOF 4/5**

Description : With this component you can preload graphics you need on other pages or simply want to have in the browser-cache. It can be used to load the counter without showing the image. When using JavaScript to preload the images then the preload-process is completely invisible on the page - when using IMG-Tags then all images will be visible with 1x1 pixel as size. Many browsers don't hide the images when setting the size to 0x0 pixel, so JavaScript is the preferred way. The JavaScript-type don't works in 2.x-browsers and IE 3.x !!

<u>Properties</u>	<u>Description</u>
• Preloader Type :	Here you set if you want to use JavaScript or normal Image-Tags to preload the images.
• Image Name-Prefix : (optional)	Here you enter the prefix for the names of the images you want to preload. If this property isn't set an automatic generated name is used.
• Nr. of Local Images :	Here you set the number of Local images you want to use. These images will be published with your project.
• Local Img. x : (optional)	Here you choose the image you want to preload.
• Nr. of Remote Images :	Here you set the number of remote images you want to use. You have to choose the URL's for the files.
• Remote Img. x : (optional)	Here you choose the URL of an image you want to preload.
